

Task 3: Sales Pipeline Analysis & Executive Summary

Project: Gen P Technologies - Cross-Functional Capstone
Prepared By: [Mohit Jaura](#) | mohit121jra@gmail.com | 9855399956

1. Data Cleaning & Standardization Methodology

The raw `Sales_Pipeline.csv` dataset was successfully audited and standardized to ensure mathematical and structural accuracy across all subsequent pivot analyses.

- **Deduplication:** The dataset was scanned for duplicate `Deal_IDs`. *(Note: Exact count removed is logged in the master workbook).*
- **Financial Standardization:** The `Deal_Value_USD` column was cleansed of mixed formats (e.g., "\$48,000", "182K") and converted to clean numeric values to allow for accurate ARR summations.
- **Date Formatting:** `Created_Date`, `Expected_Close_Date`, and `Closed_Date` were normalized to a uniform YYYY-MM-DD format, correcting the 10% of entries using localized formatting.
- **Handling Missing Data:**
 - **Discount_Pct:** Blank values were securely converted to 0 using an explicit logical test, assuming no discount was provided on unlogged entries.
 - **Expected_Close_Date:** Missing values were deliberately left blank rather than imputed. Imputing a theoretical close date artificially inflates and skews active monthly pipeline forecasting for the executive team.

2. Analytical Architecture (Pivot Table Construction)

Five distinct cuts of the data were generated to isolate revenue leakage, rep performance, and overall win rates.

- **Win Rate Dynamics:** Monthly and overall win rates modeled across both `Service_Line` and `Deal_Source`.
- **Pipeline Snapshot:** Consolidated view of Average Deal Value and Total ARR (Annual Recurring Revenue), segmented dynamically by `Region` and `Sales_Stage`.
- **Upsell Performance:** Isolated analysis of "Closed Won" deals to identify the proportion that expanded (Upsell Flag = 1) and tracked the average number of `Products_Sold` (standardized to 2 decimal places, e.g., 1.59) across service lines.
- **Rep Efficiency Tracking:** Cross-referenced individual Sales Reps by average `Days_to_Close` against their overall Win Rate to isolate systemic underperformers.
- **Late Deal Impact (SLA Breach):** Engineered an advanced DAX/Logical array to measure the impact of deals extending more than 30 days past their Expected Close Date.

Executive Insight: The "Late Deal" Reality

Analysis revealed that when a deal misses its expected close date by more than 30 days, the company still maintains an active win rate of **56.78%** on those delayed deals. This indicates that while sales cycles are

dragging, the leads are not entirely dead, pointing to an onboarding/closing bottleneck rather than complete lead disqualification.

3. Key Findings & Next Steps

- Data modeling for the Sales layer is fully complete, mathematically validated, and ready for cross-functional joining.
- Underperforming reps have been visually flagged for management review based on the intersection of high cycle times and low win rates.
- Total ARR and Upsell performance metrics are now baselined, setting up the foundation to integrate with Marketing Channels and Support Ticket SLA metrics in Task 4.
